

Assignment : Customer Onboarding Form Creation Using AWS Textract or Google Cloud Vision API

Objective:

To develop a customer onboarding form utilising AWS Textract API for extracting data from documents, with country-specific configurations and backend management through Django admin.

<https://www.figma.com/file/3KTW7wNqhUsxN9bpm8nV1T/CreateCustomerByKYC?type=design&node-id=0%3A1&mode=design&t=t8gVAdWQNxXrBaoi-1>

Technical Recommendations:

- Utilise AWS Textract API for document text extraction. (Recommended)
<https://docs.aws.amazon.com/pythonsdk/>
- You can also use Google Cloud Vision API instead of AWS

Page 1

Scope:

- Backend Setup:
 - Create Document Sets specific to each country via Django admin backend.
- Models:
 - CountryModel:
 - Define a model for countries, including a name field.
 - Add a country field to the Django User model.
 - DocumentSetModel:
 - Define a model for document sets, specifying the document name, associated countries, presence of a backside, and OCR labels in JSON format.
 - CustomerModel:
 - Create a model for customers, including fields for surname, first name, nationality, gender, and any other relevant document-specific fields.
 - Include a createdBy field linking to the User who created the customer.
 - CustomerDocumentModel:
 - Define a model for customer documents, with fields for the customer, attached file, extracted JSON data, and creation timestamp.

Sample MODELS

1. CountryModel

```
NAME = String
```

NOTE:

Add Country Field in Django User MODE as Foreign Keys

2. DocumentSetModel

```
Name Of Document = String
```

```
COUNTRY = Many2Many (CountryModel)
```

```
has_backside = Boolean
```

```
OCRLabels = Text (JsonString) # This Json is a key value pair of potentially available data from this document.
```

3. CustomerModel

```
Surname = ChoiceField
```

```
Firstname = String
```

```
Nationality = ForeignKey (CountryModel)
```

```
Gender = ChoiceField
```

```
# Create Other fields as per document.
```

```
createdBy = ForeignKey (User)
```

4. CustomerDocumentModel

```
Customer = ForeignKey (Customer)
```

```
attached_file = FILE
extracted_json = Text (JsonString) #This Json is a key value pair of
extracted data from this document.
created_at = TIMESTAMP
```

Steps:

1. Upon user login, provide two menu options: Create Customer and List Customer.
2. Under the Create Customer menu, list accepted document types based on the country assigned to the user.
3. Allow users to choose a document type, upload front and back sides (if applicable), and trigger the API for data extraction.
4. Create a CustomerModel instance based on the extracted data.
5. Save the extracted data in JSON format within the CustomerDocumentModel and display it inline in the admin interface.
6. Conclusion:
7. By following these steps, we aim to streamline the customer onboarding process, leveraging AWS Textract for efficient data extraction and Django admin for backend management.

Key Features:

- Easy Navigation: Design the form for easy navigation, allowing users to move forward and backward effortlessly.
- Colour Scheme: Adhere to the colour scheme specified in the Figma layout for consistency and brand identity.
- Quick Loading: Optimise the form for quick loading and efficient operation.
- Error Handling: Implement form error handling and data validation to ensure accurate submission and a seamless user experience.

Timeline:

The project is expected to be completed within 2 Working Days.
